

AI-Powered Resume Ranker – Deliverables

Project Deliverables Included:

- Flask Application Backend
- Resume Scoring Algorithm
- User Interface (UI)
- Sample Job Description
- Sample Resume Inputs
- Sample Outputs
- Technologies Used
- Execution Steps

1. Flask Application

The backend is developed using Flask. It handles resume uploads, PDF text extraction, NLP preprocessing, TF-IDF vectorization, and ranking logic.

2. Scoring Algorithm

The system uses SpaCy for preprocessing and TF-IDF Vectorization for converting text into numerical vectors. Cosine Similarity compares resumes with the job description and generates ranking scores.

3. User Interface

The web interface allows users to:

- Enter job descriptions
- Upload PDF resumes
- View ranked results

4. Sample Job Description

Looking for a Python Developer with skills in Python, Flask, Machine Learning, NLP, SQL, and Scikit-learn.

5. Sample Resume Content

Name: Rahul

Skills: Python, Flask, Machine Learning, NLP, SQL, Scikit-learn

6. Sample Output

Resume	Score
Resume1.pdf	91.45%
Resume2.pdf	55.20%
Resume3.pdf	18.40%

7. Technologies Used

Python, Flask, SpaCy, Scikit-learn, PyPDF2, HTML

8. Steps to Run the Project

1. Install required libraries.
2. Run app.py using Python.
3. Open the Flask website in browser.
4. Enter job description and upload resumes.
5. View ranked candidate results.

9. Conclusion

The AI-Powered Resume Ranker successfully automates resume screening using NLP and Machine Learning techniques. It reduces manual effort and improves recruitment efficiency by ranking resumes based on relevance to the job description.
